Department of Computer Engineering

Experiment No. 6

Apply Boosting Algorithm on Adult Census Income Dataset and analyze the performance of the model

Date of Performance:

Date of Submission:

Department of Computer Engineering

**Aim:** Apply Boosting algorithm on Adult Census Income Dataset and analyze the performance of the model.

**Objective:** Apply Boosting algorithm on the given dataset and maximize the accuracy, Precision, Recall, F1 score.

### Theory:

Suppose that as a patient, you have certain symptoms. Instead of consulting one doctor, you choose to consult several. Suppose you assign weights to the value or worth of each doctor's diagnosis, based on the accuracies of previous diagnosis they have made. The final diagnosis is then a combination of the weighted diagnosis. This is the essence behind boosting.

Algorithm: Adaboost- A boosting algorithm—create an ensemble of classifiers. Each one gives a weighted vote.

### **Input:**

- D, a set of d class labelled training tuples
- k, the number of rounds (one classifier is generated per round)
- a classification learning scheme

Output: A composite model

#### Method

- 1. Initialize the weight of each tuple in D is 1/d
- 2. For i=1 to k do // for each round
- 3. Sample D with replacement according to the tuple weights to obtain D<sub>i</sub>
- 4. Use training set D<sub>i</sub> to derive a model M<sub>i</sub>
- 5. Computer error  $(M_i)$ , the error rate of  $M_i$
- 6. Error( $M_i$ )= $\sum w_i * err(X_i)$
- 7. If  $Error(M_i) > 0.5$  then
- 8. Go back to step 3 and try again
- 9. endif
- 10. for each tuple in D<sub>i</sub> that was correctly classified do
- 11. Multiply the weight of the tuple by error(Mi)/(1-error(Mi))
- 12. Normalize the weight of each tuple
- 13. end for

To use the ensemble to classify tuple X

### Department of Computer Engineering

- 1. Initialize the weight of each class to 0
- 2. for i=1 to k do // for each classifier
- 3.  $w_i = log((1-error(M_i))/error(M_i))//weight of the classifiers vote$
- 4.  $C=M_i(X)$  // get class prediction for X from  $M_i$
- 5. Add w<sub>i</sub> to weight for class C
- 6. end for
- 7. Return the class with the largest weight.

#### **Dataset:**

Predict whether income exceeds \$50K/yr based on census data. Also known as "Adult" dataset.

Attribute Information:

Listing of attributes:

>50K, <=50K.

age: continuous.

workclass: Private, Self-emp-not-inc, Self-emp-inc, Federal-gov, Local-gov, State-gov, Without-pay, Never-worked.

fnlwgt: continuous.

education: Bachelors, Some-college, 11th, HS-grad, Prof-school, Assoc-acdm, Assoc-voc, 9th, 7th-8th, 12th, Masters, 1st-4th, 10th, Doctorate, 5th-6th, Preschool.

education-num: continuous.

marital-status: Married-civ-spouse, Divorced, Never-married, Separated, Widowed, Married-spouse-absent, Married-AF-spouse.

occupation: Tech-support, Craft-repair, Other-service, Sales, Exec-managerial, Prof-specialty, Handlers-cleaners, Machine-op-inspct, Adm-clerical, Farming-fishing, Transport-moving, Priv-house-serv, Protective-serv, Armed-Forces.

relationship: Wife, Own-child, Husband, Not-in-family, Other-relative, Unmarried.

race: White, Asian-Pac-Islander, Amer-Indian-Eskimo, Other, Black.

sex: Female, Male.

capital-gain: continuous.

Department of Computer Engineering

capital-loss: continuous.

hours-per-week: continuous.

native-country: United-States, Cambodia, England, Puerto-Rico, Canada, Germany, Outlying-US(Guam-USVI-etc), India, Japan, Greece, South, China, Cuba, Iran, Honduras, Philippines, Italy, Poland, Jamaica, Vietnam, Mexico, Portugal, Ireland, France, Dominican-Republic, Laos, Ecuador, Taiwan, Haiti, Columbia, Hungary, Guatemala, Nicaragua, Scotland, Thailand, Yugoslavia, El-Salvador, Trinadad & Tobago, Peru, Hong, Holand-Netherlands.

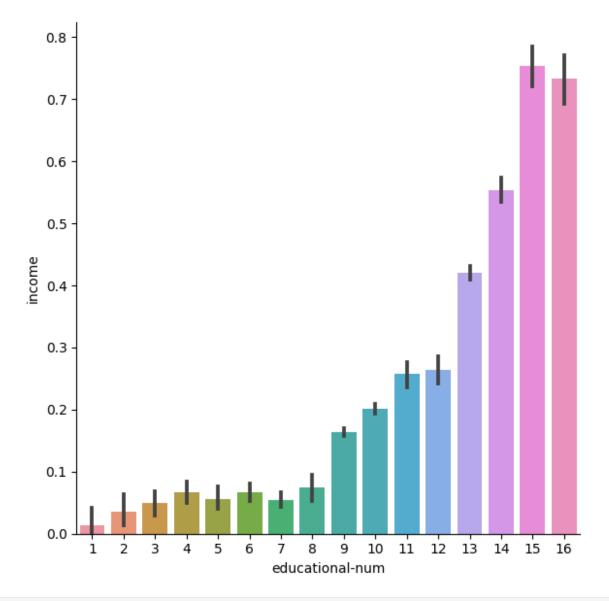

#### **Conclusion:**

- 1. The Xgboost boosting algorithm is used in the following experiment. Accuracy = 87%, precision =- 88%, recall = 94%, and f1-score = 91% was observed.,
- 2. Applying the XGBoost algorithm to the Adult Income dataset has yielded promising results. XGBoost's robustness and ability to handle complex datasets have been clearly demonstrated in this analysis. By effectively boosting weak learners and optimizing model performance, XGBoost has provided accurate predictions of income levels, which is crucial in various socio-economic applications
- 3. When comparing the results of applying boosting and random forest algorithms to the Adult Census Income Dataset, it's essential to consider the trade-offs. Boosting tends to offer higher predictive accuracy, especially for complex datasets, but may sacrifice some interpretability. On the other hand, random forests provide competitive accuracy while maintaining better interpretability and resistance to overfitting.
